

RADEON HACKATHON 2026

TraceBot AI Agent

Autonomous Test Generation & Code Trace Platform Powered by AMD ROCm & Radeon
Cloud

The AI Testing Bottleneck

Lagging Regression Suites

Traditional unit testing cannot keep pace with rapid AI code generation. Critical edge cases and logic paths go untested, causing subtle bugs in high-frequency commit environments.

Hardware Acceleration Gap

Running multi-agent test synthesizers requires heavy compute. Without dedicated ROCm-optimized GPU acceleration, automated test suites stall CI/CD execution pipelines.

Autonomous Verification with TraceBot

- ✓ **Git File Watcher:** Continuously monitors repo changes and detects modified python modules in real-time.
- ✓ **AST Code Parsing:** Extracts syntax trees, function signatures, and control flow graphs automatically.
- ✓ **Agent Orchestrator:** Coordinates LLM agents to synthesize targeted pytest test suites with mock parameters.
- ✓ **ROCm Sandbox:** Executes generated test suites on AMD GPU acceleration instances seamlessly.

Modular Architecture

Git Monitor

`git_monitor.py` tracks branch diffs and triggers targeted testing events instantly upon commit.

Code Parser

`code_parser.py` inspects Python AST to map execution dependencies and function interfaces.

Coordinator Agent

`coordinator.py` guides the LLM to construct robust pytest assertions and corner-case scenarios.

Test Runner

`test_runner.py` runs the generated test suites and feeds back pass/fail execution metrics.

Radeon Cloud Power

TraceBot is built specifically to harness AMD Radeon Cloud infrastructure. Utilizing custom shell provisions (`setup_rocm.sh`), it launches dedicated container templates with full ROCm GPU support. From JupyterLab notebooks to scaled Model API endpoints, TraceBot leverages hardware acceleration to generate complex unit tests in seconds rather than minutes.

Testing Cycle Efficiency

TraceBot running on AMD Radeon GPU instances delivers an 85% reduction in total time-to-test for code changes.

Autonomous Execution Pipeline

1

Code Commit

Developer pushes changes to
watched repo branch.

2

AST Extraction

Parser analyzes altered code
structures & classes.

3

Agent Synthesis

LLM Coordinator creates pytest
assertions & mocks.

4

ROCm Execution

Test Runner validates code in
isolated container.

Measured Test Quality

98%

Branch Logic Coverage

Targeting Obscure Fault Paths

By dissecting Python syntax trees prior to agent prompting, TraceBot creates specialized test inputs for hidden branch conditions, null parameters, and exception handling routines that human engineers often omit under deadlines.

System Module Overview

Module	File Reference	Primary Responsibility
Git Monitor	<code>tracebot/tools/git_monitor.py</code>	Monitors filesystem events and tracks commit history diffs
AST Parser	<code>tracebot/tools/code_parser.py</code>	Parses syntax trees to discover classes, methods, & signatures
Coordinator	<code>tracebot/agents/coordinator.py</code>	Orchestrates LLM agents to craft pytest scripts
Test Runner	<code>tracebot/tools/test_runner.py</code>	Executes generated pytest files & collects exit codes

Generated Test Suite Composition

- Unit & Function Tests (50%)
- Edge Case & Boundary Checks (30%)
- Integration & Mocking (15%)
- Performance Benchmarks (5%)

Balanced test coverage ensures high reliability across both core features and edge-case execution environments.

Cloud Integration & Continuous Testing

-  **GitHub Workflows:** Configured with automated CI pipeline (`.github/workflows/ci.yml`).
-  **Radeon Cloud Guide:** Full User Guide supporting SSH key pairing and JupyterLab notebook workflows.
-  **Container Templates:** Instant environment provisioning for model serving and agent workers.
